Some will wonder how this is what I have the answer to. The smart home already includes technology for remote control of the light by supplying electricity to various devices in the house.

I believe that a smart home is one of those technologies that everyone should have, because it is not very expensive and very practical. For example, I can calmly approaching the house to put a kettle to brew and come home I will have ready tea or coffee. You can ask him different things since he is connected to the Internet and can always answer any question.

But some people oppose this and believe that it is not at all necessary as they themselves can make tea on or off lighting and more. It is also expensive for some people. Some are afraid because of low security, because there is a chance of hacking in order to harm the owner of this technology.

I can argue that this is not entirely true. Because this technology is protected, it uses a private network which is very difficult to crack. After all, before everyone did not understand why this was and what it was for, but now everyone has a telephone. I believe that the same will happen with smart home technology. This is just a convenient invention that makes life easier.

In conclusion, I want to say that smart home is an excellent technology due to which life will become easier and more convenient.
