I think that it is necessary to explore space as it will be useful to us in the future because thanks to our advanced technology we can open space tourism in which every inhabitant of the earth can participate, but before that people must master the cosmos to study it for years to make conditions for travel and for development this industry in space and even more so in the 21st century, technology is developing at the speed of light that even the 2017 gadgets are becoming old and no one needs them, and even more so there are such powerful countries on earth that have everything to create this tourism so yes it's necessary to do so that in the future our children or grandchildren fly there and travel through space, but this requires years or decades to build this and research for the blessing, besides smart professors and scientists, we need money to finance this project. People are already thinking about it. In this and in the near future we can fly like in a movie Star Wars and this will enrich the developed countries that can do this, for example, the United States and Europe through space tourism in general, I think it's time to do it already and spend decent money on it so that we can implement our plans for space, so yes it needs to be done

However, some people think that we should not waste time and money for space traveling. They believe that money which is usually spent on space research could be given to poor people who die from hunger. I don't agree with it. I am sorry for poor countries too but we should reduce poverty not by means of reducing money for space development, but for money which is spent on wars and military needs.

To sum up, there are two opposite opinions about space exploration. But I personally think that traveling to space is useful and challenging thing for science, technologies and people in general.
