In my view, science is very important to most people for many reasons. And science is very important for our understanding of the world and technology.

Technology has penetrated every aspect of our lives, changing how we work, how we learn, how we live. We use computers at work and in the home. Nowadays we can't do without mobile phones, PCs, digital tape recorders, laptops, fax machines and air conditioners.

All these gadgets facilitate our lives and save our time. We communicate through mobile phones, SMS messages and various social networks. Mobile phones enable us to stay in touch and to be reachable everywhere, they give us the freedom of movement. The Internet is a great source of information for people. Many people can find a job through the Internet. In addition, the widespread use of Internet has brought about profound changes to political, economic and cultural arenas. Social networks bring together users of different ages and professions.

Also, some people believe that internet dating may help find love. But I doubt it.

Technology, doubtlessly, simplifies life. On the other hand, technological progress has brought many negative effects to our lives. For example, some scientists say that social networks are halting our emotional development. Some cars have negative effects on the environment, such as pollution. Unfortunately, people can use technology to create weapons of massive destruction. But I think that the future of the planet is in our hands. Therefore, people should use technology wisely in benefit to their lives.
