Modern humanity is now living in the era of high-speed Internet. Nowadays, it is difficult to imagine someone without an expensive smartphone with high-speed Internet access. However, did you think about what would happen if the speed of the World Wide Web decreases every day?

In my opinion, if the speed of the Internet decreases, then for me it will really be a problem. I will explain why .

I can say with confidence that on the Internet my whole life. Social networks, chatting with friends, that live in other countries thousands of kilometers away from me. Again, my studies are also online. I think this will negatively affect all young people. After all, everyone knows that today's young people often use gadgets for many things related to the Internet. I can cite as an example one case when not only the speed of traffic decreased, but several sites did not withstand a huge load and broke. It will be about such social networks as Twitter and YouTube and about my favorite group - Bts. Every time there is a comeback of this group, there is a terrible overload of these two sites, because in one second about a million people come in, and as a result, the sites do not withstand the loads and break.

Another thing is adults or those who rarely use the Internet. I can assume that if the Internet speed decreases, then adults and elderly people will not pay attention to it, because they rarely or not at all use social networks, instant messengers, YouTube and other sites that are popular with the younger generation.

In conclusion, I want to say that if the Internet will be decrease, then, first of all, it will affect young people, and I think that there will certainly be worries about this.
