Can you imagine what our life will be like in 15 years now? Perhaps we will live more than 100 years, or will a flight to the moon or Mars be considered a walk for people. Nobody will give a definite answer to these questions.

Firstly, the introduction of robots will be a vocal introduction into the industry, to reduce the cost of human labor and time to perform a particular function. For example, there will be no drivers in the metro and public transport and the system will be built in such a way that everything will move automatically, or using universal robots.

Secondly, what you need to pay attention to is the study of people using computers. There is no guarantee, that after 10 years, schoolchildren will be completely restricted from schools and students from universities, when everyone will have the opportunity to study online. Also, if we are already talking about the computer, people will find friends, wives and husbands through social networks, which indicates a new standard of living. Human contact will decrease to a minimum, as people will be isolated from each other.

Thirdly, based on the low environmental situation in the world, cars will be replaced by electric ones or those that will work on solar panels, which will naturally reduce the level of pollution of our planet or minimize it.

In conclusion, I want to say that no matter how our lives change in a few decades, people need to take care of our planet, try to make it a better place to live, and make a definite contribution to the development of the future.
