Nowadays the technologies have gone so far, to make our lives easier. However about 50 years ago we hadn't even a home telephone. Some people couldn't live without devices today. They wake up, spend the day and even go to bed with gadgets. While others are not use them so much in their usual life.

On the one hand, technologies help us a lot in everyday life. It greatly reduces the time of work at home, and takes some of the worries on themselves. As a result, we have more time to rest and do more important things. As they say, laziness is the engine of progress. Therefore, some people prefer to build themselves a smart home. With help of it, you can't be afraid for the safety of your apartment, do not worry if you forgot to turn off the water and iron, and feed the animals. Also, at any time you can see what happens in the apartment when you are not there. It also helps to maintain a comfortable temperature and humidity at home. Everything is done for our safety and to simplify our lives.

On the other hand, like any electronics, it can fail. Or worse, it could short out and start a fire. We can also get very lazy and forget how to do basic things. Therefore, many people are afraid to trust all home management to gadgets. Especially for older people, it is simply difficult to master all these new technologies, they are already used to doing everything with their own hands. In addition, a smart home is very expensive.

As for me, would I like to live in a smart home? I think I would. When you live in a large metropolis such as Moscow, you have to be constantly on the move, come home to sleep, and in the morning again run away to work. In this rhythm, sometimes there is simply no time for household chores. It's cool when you have technologies that will help you maintain comfort and cleanliness.

To sum up, despite the fact that technology has recently developed so much and made life easier for us, we need to use them wisely.
