We learned about “smart homes” not so long ago, although in the works of science fiction writers something similar was described many years ago.

In our time, this idea has found its embodiment in the creation of the "Smart House" system. Its main goal is to make human life the most comfortable, economical and safe. This system takes over the management of all engineering networks in the house, monitors heating, lighting, turns on and off devices, and if necessary, eliminates deficiencies.

A fire cannot happen in a “smart home”, because the system will notice the source of danger in time and eliminate it. Heating will not work here in warm weather, the temperature in the room will always be optimal for the people living there.

Some ideas for a “smart home” are already being used everywhere. For example, automatic lighting systems are installed in many porches. This allows residents not to wander in the dark and at the same time not to burn the light in vain, because the lighting turns on when a person enters and turns off when he leaves.

Also, the owners of such houses can significantly save on heating, since the system takes into account the season, weather outside, humidity and other factors.

The creators of the "Smart Home" system paid special attention to the safety of all family members. Video cameras, motion sensors monitor the area near the house. And in case of illegal entry, an alarm is triggered. It should be noted that the functions of this system are constantly being improved.

It is hoped that over time they will become available to most people. After all, a house is a place where we rest with our souls, so we really want it to be cozy and comfortable. I think the "smart house" can become the place where i will always live.
